

ABSTRACT OF THE DISCLOSURE

A system is provided for providing real-time search information, which comprises a mobile terminal for transmitting by radio a signal requesting detailed
5 information about multimedia data and outputting detailed information received by
radio in response to the request; a search system comprising an information database
storing relevant information about multimedia data, checking whether any information
in the information database matches multimedia data, about which detailed
information has been requested, sending a signal requesting detailed information
10 corresponding to the matching information, if any, and when the requested detailed
information is received, transmitting the received detailed information to said mobile
terminal; and a plurality of information providing servers for collecting detailed
information corresponding to the matching information upon receiving a signal
requesting the detailed information from said search system, and sending the collected
15 information to said search system.
